SUMMARY

Final-year B.Tech Computer Engineering student building document-processing, cloud and mobile software. Three internships: State Bank of India (two) and Mazagon Dock Shipbuilders.

EDUCATION

Bachelor of Technology, Computer Engineering, K.J. Somaiya College of Engineering — Final year
Coursework: Natural Language Processing, Cloud Computing, AR/VR, Network and Information Security

EXPERIENCE

Summer Intern, State Bank of India, Analytics Department — May 2026 - Jul 2026

- Project: image to structured dataset conversion and predictive model building. Built a production pipeline that extracts structured tables from scanned telecom audit PDFs into Excel, using a hybrid of computer vision (PyMuPDF, OpenCV) and a vision-language model.
- Compared three architectures on the same documents (Table Transformer, a pure vision-language model, and Docling) before choosing the hybrid design.
- Added a fast pre-scan for key header fields and the conclusion-table pages, and switched to lazy page generators after eager rendering exhausted memory.
- Fixed a column-splicing bug that turned an 11-column table into 24 phantom columns, and added a guard that rejects implausible vision-language model cell text.
- Generated synthetic scanned PDFs with noise and skew for testing, and documented the system in a 16-page technical report.

Industrial Training Intern, Mazagon Dock Shipbuilders Limited, CIT Department — Jun 2025

Summer Intern, State Bank of India, Business Intelligence Department — Jun 2024

- Project: Dashboard Access Management Tool. Completed the project and submitted a project report.

PROJECTS

The Tangled Path: Choice-Based Anti-Drug Game (HTML, CSS, JavaScript) — sudo-choices.vercel.app

- 1st runner up at a hackathon. Team leader and front-end developer on a team of four.
- A story game that follows one character through four life stages (ages 6, 15, 25 and 70), where each choice leads toward a good or a bad ending.
- Includes a built-in story teller and a full-screen mode. Deployed on Vercel.

MouseShare (Python, Kotlin, Android)

- Built because I could not find an existing tool that shares a Windows PC's mouse and keyboard with an Android phone: a Python desktop app captures input and a Kotlin Android app receives and acts on it.
- Comparing transports (HID keyboard and mouse, WiFi) to cut input lag.

GIF Crop and Overlay Tool (JavaScript, HTML, Canvas) — piyushchy.github.io/gif-tool

- Built because I could not find an existing tool that crops a GIF to a freehand or polygon shape or overlays one GIF on another with frame-level control.
- Overlay mode has two frame tracks to slide against each other, plus per-frame blank, skip and hold. Wrote the GIF decoder and encoder from scratch (LZW, median-cut palette). Runs entirely in the browser.

Cloud-Native App on AWS (Docker, AWS ECR, ECS Fargate, ALB, RDS MySQL, CodePipeline, SNS)

- Containerized a Node.js app and deployed it on ECS Fargate behind an Application Load Balancer, with the image stored in ECR.
- Connected to an RDS MySQL database through a bastion host over Session Manager, and added a CodePipeline CI/CD flow and an SNS alarm.

RNN vs LSTM Text Classification (Python, PyTorch, Google Colab)

- Trained and compared a plain RNN and an LSTM on the same text classification task in a runnable Google Colab notebook.

TECHNICAL SKILLS

Languages: Python, Java, Kotlin, JavaScript, HTML, CSS
Web: React.js, HTML5, CSS3
Computer vision and document AI: OpenCV, PyMuPDF, EasyOCR, Table Transformer, Docling, Pillow, vision-language models
Machine learning: PyTorch, RNN, LSTM
Cloud and infrastructure: Docker, AWS (ECR, ECS Fargate, ALB, RDS MySQL, EC2, CodePipeline, SNS)
Tools and systems: Linux, Command Line (CLI), SSH, Git, GitHub, Google Colab, openpyxl
